Education

Bachelor of Applied Computer Science, Dalhousie University – Halifax, NS *Sept 2022 – Present*

Experience

Junior Developer (Healthcare Client Project) *Jan 2024 – Apr 2024*

Client Project - Dalhousie University - Halifax, NS

- Developed a production-level healthcare web application using React, Node.js, Express.js, and MySQL to support clinical workflows and secure access to healthcare information.
- Collaborated with healthcare stakeholders and cross-functional teammates to gather requirements, troubleshoot issues, and deliver user-focused software solutions.
- Developed and tested RESTful APIs for user management, search functionality, and feedback collection while maintaining data integrity and application reliability.
- Optimized application performance through UI enhancements, backend improvements, and debugging, contributing to a 52% increase in user engagement.
- Performed application testing, issue resolution, and backend validation to improve system stability, reliability, and overall user experience.

Projects

Utility Data Analytics Platform — SQL Server, Power BI, DAX, Python *Feb 2026 – Apr 2026*

- Designed and developed a SQL Server database containing over 60,000 utility records across six normalized tables to support business applications and operational reporting.
- Built a Python ETL pipeline to extract, clean, validate, and transform meter data while implementing automated quality checks that reduced data issues by 70%.
- Developed interactive Power BI dashboards using DAX to monitor operational KPIs, revenue trends, and customer usage patterns.
- Automated reporting workflows using Excel VBA and paginated reports, reducing manual reporting effort by 65%.
- Performed data validation, troubleshooting, and quality assurance to ensure reliable application data and reporting accuracy.

F1 Racing Analytics System (Cloud Hosted) — Python, MySQL, AWS EC2, SQL *Jan 2025 – Mar 2025*

- Designed and implemented a normalized MySQL database across eight relational tables modeling Formula One seasons from 2014–2022.
- Built a reusable Python ETL pipeline to ingest, clean, and standardize over 3,000 race records for analytics and reporting.
- Developed 20+ advanced SQL queries using joins, aggregations, and window functions to support business reporting and performance analysis.
- Performed data validation, referential integrity checks, and anomaly detection, reducing invalid data loads by approximately 90%.
- Deployed the analytics backend on AWS EC2, enabling scalable ETL execution and reliable application performance.

Premier League Match Predictor — Python, Pandas, Scikit-learn, Streamlit *Dec 2025 – Jan 2026*

- Built a machine learning application using over 2,000 Premier League matches from the 2018–2024 seasons.
- Cleaned, transformed, and analyzed historical data using Pandas to prepare datasets for model development.
- Engineered predictive features and trained Logistic Regression and Random Forest models achieving 65–70% prediction accuracy.
- Developed an interactive Streamlit application to deliver real-time match outcome predictions through a user-friendly interface.

Skills

Programming	Java, Python (Pandas, Scikit-learn), JavaScript, SQL
Web Development	React.js, Node.js, Express.js, REST APIs
Databases	SQL Server, SSMS, MySQL, phpMyAdmin, Database Design, Complex Joins, Aggregations, Window Functions
Application Development	Application Testing, Debugging, Troubleshooting, Data Validation, ETL Pipelines
Data Analytics	Power BI, DAX, Paginated Reports, Advanced Excel
Cloud Platforms	AWS (EC2, S3, IAM, VPC)
Tools	Git, GitHub, Jira, Postman, Microsoft Office (Word, Excel, PowerPoint)
